## 1 Smart Place: AI-Based Semantic Talent Matching Platform

### ABSTRACT
Campus placements often rely on manual resume screening, causing inefficiencies and inaccurate shortlisting.
**SmartPlace** is an AI-based placement system using NLP.
It extracts skills from resumes and performs semantic job matching using Sentence-BERT. The system provides match scores, skill gap suggestions, and helps administrators quickly shortlist candidates.

### UNIQUENESS
- Automated Resume Skill Extraction
- Skill Gap Prediction
- Transformer-Based Semantic Matching
- Dual Dashboard System

### METHODOLOGY
The methodology uses NLP to extract skills from uploaded resumes using spaCy. Sentence-BERT generates embeddings for resumes and job descriptions, and cosine similarity calculates the match score. The system ranks candidates and provides skill gap suggestions, enabling administrators to quickly shortlist suitable candidates.

### SOCIETAL USE
The SmartPlace system contributes to efficient and fair campus recruitment by automating resume screening and job matching. Using NLP and semantic analysis, it accurately identifies suitable candidates based on skills and job requirements. The system provides match scores and skill gap suggestions to guide students in improving their profiles. With automated candidate shortlisting and an intuitive dashboard for administrators, this platform improves efficiency, transparency, and decision-making in campus placements.

Job Match Results
